Acute maxillary sinusitis is a most common disease among odontogenic infections and may be complicated. Intracanal infection of the maxillary sinus is the most severe complication. Maxillary sinusitis is frequently treated by a therapeutic endoscopic procedure. The following approach and methods of endoscopic surgery with therapeutic endoscopic sinus surgery (TESS) are well established. This paper presents a first-line method of treatment of acute maxillary sinusitis, consisting of a prolonged repeated intubation of the anterior meatus with a silicone tube. We examined 32 patients with acute maxillary sinusitis, with risk factors for sinusitis: steroid intake, dental infections, dental procedures, tonsillectomy, chronic sinusitis, and odontogenic infections. All patients were intubated with a silicone tube for 10-20 days (depending on progress of inflammation). There were no complications or failures with this procedure. Results were good and the tube was removed according to clinical progress. Acute maxillary sinusitis can be treated with a protracted repeated intubation of the
